12-Month Indian Equity Investment Blueprint — Consolidated Executable Dossier (Feb 2026)

Important upfront disclaimers

- This report is prepared using public information and industry knowledge as of Feb 2026. Validate live quotes and latest filings before executing trades.
- Numerical values (multiples, ROE, debt ratios) are indicative based on the research dossier; use live market data at order entry.
- This is a long-only, institutional-style concentrated 20-stock core-satellite portfolio. Adjust allocations to your risk tolerance and liquidity needs.

Contents (clickable sections)

- Executive market outlook
- Valuation framework
- Sector diversification & allocation model
- Ranked 20-stock summary table (conviction-ranked)
- Detailed one-page stock sheets (20 names)
- Portfolio allocation models (₹10L / ₹25L / ₹50L)
- Defensive vs Growth balancing and capital allocation strategy
- Risk matrix & risk-management rules
- Bull / Base / Bear scenario modeling (numerical)
- Entry & exit strategy framework (bookings, stop-loss)
- Monitoring & quarterly review checklist
- Rebalancing rules & execution notes
- Appendix: How to tilt to hit a 25% portfolio target (practical steps)

PART A — Executive summary & 12-month macro outlook

- Macro thesis (12 months): India should remain a relative outperformer: CPI likely 4–6% with RBI in calibrated mode; GDP 6–7% supported by government capex (infra, defence, digital) and gradually re-accelerating private capex. Export tailwinds for IT & pharma persist. Main downside risks are global monetary shocks, sharp commodity moves and geopolitical disruptions.
- Market implication: Build a diversified, quality-biased portfolio — mix defensive high-ROE names and cyclical recovery plays with visible catalysts (order books, monetization events, capacity ramps). Maintain liquidity (5–10% dry powder) and explicit stop-loss/rebalancing discipline.
- Target outcome: Construct a 20-stock portfolio aiming for an approx. 25% upside potential over 12 months at portfolio-level under a constructive base/bull environment. Base-case blended return modeled below (numerical).

PART B — Valuation framework & selection methodology Valuation approach (how we pick targets & bands)

1. Universe & filters

- Initial: Top 500 listed Indian companies (NSE/BSE).
- Quality filters: 3–5 year ROE preferably >15% or a demonstrable path to >15%; revenue & EPS growth positive; improving FCF conversion; reasonable leverage; interest coverage >4x for industrials; clean governance.

2. Valuation overlay

    - Two-pronged: (A) multiple-justified value vs peers (P/E, EV/EBITDA, P/B) and (B) catalyst-driven re-rating over 12 months (deal wins, monetisation, margin recovery).
    - Seek margin of safety: trade inside accumulation bands (entry bands) and use DCF/justified-multiple checks where appropriate.

3. Final selection

    - Balanced mix: core large-caps for stability, mid-caps for growth, select small-caps for alpha. 20 names selected to be diversified across sectors with conviction ranking.

Valuation signals used to set entry bands & targets

- Use consensus FY27–FY28 EPS and reasonable multiple compression/expansion scenarios.
- Entry band = accumulation zone where risk/reward acceptable (usually 5–15% below current market or within recent support).
- 12-month target = realistic blend of earnings growth + modest multiple expansion (or catalyst-driven re-rating) aiming at portfolio-level upside near target.

PART C — Sector diversification model (weights used for portfolio construction) Sector allocation logic (goal = diversification + conviction)

- Financials (Banks + NBFCs): 20–25%
- IT Services: 15–20%
- Consumer (FMCG & Discretionary & Lifestyle): 20–25%
- Industrials / Infra / Capex plays: 10–15%
- Pharma & Healthcare: 7–10%
- Auto & Auto components: 5–10%
- Building Materials / Paints / Cement: 6–12%
- Diversified / Conglomerate (Reliance): 5–10% Allocation achieved in the portfolio (model weights below) closely matches these targets.

PART D — Ranked 20-stock summary table (conviction-ranked; base-case 12-month targets) Note: "Entry band" = accumulation range to execute buys via staggered tranches. "Base-case upside" = modeled 12-month % from mid entry to target (representative).

1. Tata Consultancy Services (TCS) — IT Services

    - Entry band: INR 3,600–3,900
    - 12-month target: INR 4,500
    - Base-case upside: 20%
    - Risk: Low–Moderate

2. Infosys — IT Services

- Entry band: INR 1,900–2,100
- Target: INR 2,450
- Upside: 25%
- Risk: Low–Moderate

3. Bajaj Finance — NBFC / Consumer Finance

- Entry: INR 7,200–8,000
- Target: INR 9,600
- Upside: 25%
- Risk: Moderate–High

4. ICICI Bank — Private Bank

- Entry: INR 1,050–1,200
- Target: INR 1,400
- Upside: 25%
- Risk: Moderate

5. Reliance Industries (RIL) — Energy / Retail / Digital

- Entry: INR 2,900–3,400
- Target: INR 3,600
- Upside: 18%
- Risk: Moderate

6. Asian Paints — Paints & Coatings

- Entry: INR 3,000–3,400
- Target: INR 3,800
- Upside: 20%
- Risk: Moderate

7. Hindustan Unilever (HUL) — FMCG

- Entry: INR 3,250–3,600
- Target: INR 4,100
- Upside: 18%
- Risk: Low–Moderate

8. Kotak Mahindra Bank — Private Bank

- Entry: INR 2,000–2,300
- Target: INR 2,600
- Upside: 20%
- Risk: Moderate

9. Larsen & Toubro (L&T) — Engineering & Construction

- Entry: INR 2,800–3,200
- Target: INR 3,500
- Upside: 20%
- Risk: Moderate–High

10. Maruti Suzuki — Auto (Passenger Vehicles)

    - Entry: INR 12,000–13,500
    - Target: INR 15,000
    - Upside: 18%
    - Risk: Moderate

11. Titan Company — Jewellery & Lifestyle

    - Entry: INR 3,300–3,800
    - Target: INR 4,200
    - Upside: 18%
    - Risk: Moderate

12. Divi's Laboratories — APIs & CDMO

    - Entry: INR 4,800–5,400
    - Target: INR 6,200
    - Upside: 20%
    - Risk: Moderate

13. Dr. Reddy’s Laboratories — Pharmaceuticals

    - Entry: INR 6,000–6,800
    - Target: INR 8,000
    - Upside: 20%
    - Risk: Moderate

14. UltraTech Cement — Cement / Building Materials

    - Entry: INR 9,000–10,500
    - Target: INR 12,000
    - Upside: 25%
    - Risk: Moderate

15. Eicher Motors (Royal Enfield) — Premium Motorcycles

    - Entry: INR 3,500–4,000
    - Target: INR 4,600
    - Upside: 25%
    - Risk: Moderate

16. Nestle India — Packaged Foods

    - Entry: INR 25,000–28,000
    - Target: INR 32,000
    - Upside: 18%
    - Risk: Low–Moderate

17. Berger Paints — Paints (mid-cap)

    - Entry: INR 600–720
    - Target: INR 840
    - Upside: 20%
    - Risk: Moderate

18. Page Industries — Branded Apparel (Jockey)

    - Entry: INR 40,000–45,000
    - Target: INR 52,000
    - Upside: 20%
    - Risk: Moderate

19. Bharat Electronics (BEL) — Defence Electronics (PSU)

    - Entry: INR 150–180
    - Target: INR 220
    - Upside: 25%
    - Risk: Moderate–High

20. Sun Pharmaceutical — Pharmaceuticals

    - Entry: INR 1,000–1,250
    - Target: INR 1,300 (base)
    - Upside: 18%
    - Risk: Moderate

Summary note: targets use a combination of earnings growth and modest multiple expansion; they align with each company's catalysts (deal wins, monetization, orderbook, capacity ramps).

PART E — Detailed one-page stock sheets (condensed institutional format) (Each sheet = Investment thesis | Entry band | 12-month target | Upside | Key metrics (indicative) | Risk classification | Bull / Base / Bear scenarios | Catalysts | Exit guidance | Governance note)

For readability, the 20 sheets are presented in sequence (full content is from the dossier). Below are compact, decision-ready sheets for each name (numbers indicative — validate before trade).

1. Tata Consultancy Services (TCS) — IT Services

- Thesis: #1 Indian IT; resilient revenue mix; strong FCF and conversion; high ROE.
- Entry: INR 3,600–3,900 | Target: INR 4,500 | Upside: 20% | Risk: Low–Moderate
- Key metrics (indicative): P/E 24–28, EV/EBITDA 18–20, ROE 40%+, debt ~0.
- Scenarios: Bull 30% (deal wins & margin), Base 20%, Bear -5% (client slippage).
- Catalysts: large deal ramp-ups, margin guidance, rupee moves.
- Exit: Trim 25% on target; trailing stop 10% off peak.

1. Infosys — IT Services

- Thesis: Strong digital & cloud; improving large deal pipeline; shareholder returns.
- Entry: INR 1,900–2,100 | Target: INR 2,450 | Upside: 25% | Risk: Low–Moderate
- Metrics: P/E 22–26, ROE ~25–35%, net cash.
- Scenarios: Bull 35%, Base 25%, Bear -5%.
- Catalysts: large deal wins, margin improvement, buyback.
- Exit: Book 25–30% at target; re-assess on guidance misses.

1. Bajaj Finance — NBFC

- Thesis: Best-in-class retail credit engine; superior underwriting & digital distribution.

- Entry: INR 7,200–8,000 | Target: INR 9,600 | Upside: 25% | Risk: Moderate–High
- Metrics: ROE 20–30%, leverage managed, high NIM potential.
- Scenarios: Bull 35%, Base 25%, Bear -20% (credit stress).
- Catalysts: loan growth, NIM improvement, product launches.
- Exit: Tight monitoring of GNPA; reduce if GNPA/provisions up >50bps quarter-on-quarter.

1. ICICI Bank — Private Bank

- Entry: INR 1,050–1,200 | Target: INR 1,400 | Upside: 25% | Risk: Moderate
- Thesis: Large retail franchise; improving NIMs & CASA; strong capital.
- Metrics: P/E 12–15, ROE 15–18%.
- Scenarios: Bull 35%, Base 25%, Bear -15%.
- Catalysts: NIM reset, improved corporate demand.
- Exit: Book at target or if asset-quality weakens >25% from current trend.

1. Reliance Industries (RIL)

- Entry: INR 2,900–3,400 | Target: INR 3,600 | Upside: 18% | Risk: Moderate
- Thesis: Diversified cash engines: petrochem + retail + Jio (digital); monetization optionality.
- Metrics: P/E 20–24, improving debt profile.
- Scenarios: Bull 30% (asset monetization), Base 18%, Bear -10%.
- Catalysts: Jio/Retail stake sales, green energy progress.
- Exit: Take profits on monetization announcements; monitor capex guidance for new energy.

1. Asian Paints

- Entry: INR 3,000–3,400 | Target: INR 3,800 | Upside: 20% | Risk: Moderate
- Thesis: Pricing power, distribution, premiumization.
- Catalysts: raw-material tailwinds, volume recovery.
- Exit: Trim if margins fall for two consecutive quarters.

1. Hindustan Unilever (HUL)

- Entry: INR 3,250–3,600 | Target: INR 4,100 | Upside: 18% | Risk: Low–Moderate
- Thesis: Defensive, pricing power, rural distribution.
- Exit: Partial profit booking at target; rotate proceeds into cyclical re-rating opportunities.

1. Kotak Mahindra Bank

- Entry: INR 2,000–2,300 | Target: INR 2,600 | Upside: 20% | Risk: Moderate
- Thesis: Conservative balance sheet, high ROE potential with franchise growth.

1. Larsen & Toubro (L&T)

- Entry: INR 2,800–3,200 | Target: INR 3,500 | Upside: 20% | Risk: Moderate–High
- Thesis: Order book visibility; benefits from public & private capex.
- Exit: Book partial when orderbook misses or execution margins compress.

1. Maruti Suzuki

- Entry: INR 12,000–13,500 | Target: INR 15,000 | Upside: 18% | Risk: Moderate

- Thesis: Market leader; model refreshes & rural recovery are the play.
- Exit: Trim on supply-chain shocks or industry demand slump.

1. Titan Company

- Entry: INR 3,300–3,800 | Target: INR 4,200 | Upside: 18% | Risk: Moderate
- Thesis: Jewellery market leadership; premiumization & financing tie-ups.

1. Divi's Laboratories

- Entry: INR 4,800–5,400 | Target: INR 6,200 | Upside: 20% | Risk: Moderate
- Thesis: API leader; CDMO tailwinds; strong FCF.
- Exit: Trim after significant capacity ramp or contract wins are fully priced.

1. Dr. Reddy’s Laboratories

- Entry: INR 6,000–6,800 | Target: INR 8,000 | Upside: 20% | Risk: Moderate
- Thesis: Global generics + specialty push.

1. UltraTech Cement

- Entry: INR 9,000–10,500 | Target: INR 12,000 | Upside: 25% | Risk: Moderate
- Thesis: Scale + pricing power regionally; infrastructure demand positive.

1. Eicher Motors

- Entry: INR 3,500–4,000 | Target: INR 4,600 | Upside: 25% | Risk: Moderate
- Thesis: Royal Enfield global expansion + margin expansion from exports.

1. Nestle India

- Entry: INR 25,000–28,000 | Target: INR 32,000 | Upside: 18% | Risk: Low–Moderate
- Thesis: Defensive premium food franchise; high ROIC.

1. Berger Paints

- Entry: INR 600–720 | Target: INR 840 | Upside: 20% | Risk: Moderate

1. Page Industries

- Entry: INR 40,000–45,000 | Target: INR 52,000 | Upside: 20% | Risk: Moderate
- Thesis: Brand moat; strong wholesale & retail expansion.

1. Bharat Electronics (BEL)

- Entry: INR 150–180 | Target: INR 220 | Upside: 25% | Risk: Moderate–High
- Thesis: Defence capex beneficiary; localisation ramp.

1. Sun Pharmaceutical

- Entry: INR 1,000–1,250 | Target: INR 1,300 | Upside: 18% | Risk: Moderate
- Thesis: Domestic & global generics, specialty growth on product launches.

(End of 20 one-page sheets — validate live metrics before trade.)

PART F — Portfolio construction & capital allocation (numeric, actionable) Principles

- Core-satellite: Core = top 10 names (60–70%); Satellite = remaining 10 (30–40%).
- Max position size (default): 8–10% per stock for balanced portfolios. Higher conviction may justify up to 12% but track concentration risk.
- Cash buffer: 5–10% recommended for tactical dips.
- Position sizing ties to conviction ranking, liquidity & volatility.

Model weight scheme used (recommended starting allocation)

- Tier A (Top 5, high conviction): 8% each = 5 × 8% = 40% total (TCS, Infosys, HUL, Nestle, Bajaj Finance)
- Tier B (Next 5, strong conviction): 6% each = 5 × 6% = 30% total (Reliance, Asian Paints, ICICI, Kotak, L&T)
- Tier C (Satellite 10): 3% each = 10 × 3% = 30% total (Maruti, Titan, Divi's, Dr Reddy's, UltraTech, Eicher, Berger, Page, BEL, Sun Pharma)

This allocation produces a diversified core-satellite portfolio: core (top10) = 70%, satellite = 30%.

Portfolio allocation examples — exact rupee amounts

1. Conservative model — ₹10,00,000 (10L)

- Tier A (8% each): ₹80,000 per stock × 5 = ₹4,00,000
- Tier B (6% each): ₹60,000 per stock × 5 = ₹3,00,000
- Tier C (3% each): ₹30,000 per stock ×10 = ₹3,00,000
- Cash: recommended 5–10% (absorb within slight adjustments)

1. Balanced model — ₹25,00,000 (25L)

- Tier A: ₹2,00,000 per stock × 5 = ₹10,00,000
- Tier B: ₹1,50,000 per stock × 5 = ₹7,50,000
- Tier C: ₹75,000 per stock ×10 = ₹7,50,000

1. Growth model — ₹50,00,000 (50L)

- Tier A: ₹4,00,000 per stock × 5 = ₹20,00,000
- Tier B: ₹3,00,000 per stock × 5 = ₹15,00,000
- Tier C: ₹1,50,000 per stock ×10 = ₹15,00,000

Notes:

- For illiquid mid/small caps, round to nearest tradeable lot and use smaller initial tranche sizes.
- For portfolios >₹25L consider index option overlays (puts/rolls) to manage tail risk.

Expected portfolio return (weighted)

- Using base-case per-stock expected upside (see stock table) and the Tier-weight scheme above:
  - Weighted base-case expected portfolio upside ≈ 21.0% over 12 months (numerical).
  - Explanation: Weighted blend uses 8/6/3% scheme and per-stock base upside assumptions (TCS 20%, Infosys 25%... etc).
- Note: This base-case is conservative relative to stated portfolio aspiration of 25% — to

achieve 25% you need either:

1. Slight tactical overweight to higher-upside names (Infosys, Bajaj Fin, ICICI, UltraTech, Eicher, BEL), OR
2. Broad market multiple expansion (re-rating), AND/OR
3. Bull-case earnings beats across several holdings.

- I provide a practical "tilt" section at the end showing how to push expected to ~25% (aggressive allocation variant).

PART G — Defensive vs Growth balancing

- Default (recommended): Core (defensive/quality) 60–70%: TCS, Infosys, HUL, Nestle, Reliance, ICICI, Kotak, Asian Paints, L&T, Bajaj Finance.
- Satellite (growth / cyclical) 30–40%: UltraTech, Eicher, Divi's, Dr Reddy's, Maruti, Titan, Berger, Page, BEL, Sun Pharma.
- Rationale: Defensive holdings reduce volatility and reliably compound; satellite positions provide upside alpha from sector cyclical recovery or stock-specific catalysts.

PART H — Risk matrix (per-stock & portfolio rules) Risk classification (high-level)

- Low risk: TCS, Infosys, Nestle, HUL
- Moderate: Asian Paints, Reliance, ICICI, Kotak, Divi's, Dr Reddy's, Titan, UltraTech, Maruti, Berger, Page
- Moderate–High: Bajaj Finance, L&T, Eicher, BEL, Sun Pharma

Key portfolio risk rules (hard constraints)

- Maximum single-stock weight: 12% (hard cap). Default recommended max 8–10%.
- Maximum single-sector exposure: 30% (monitor correlated exposures).
- Stop-loss per stock (guideline):
  - Large caps (liquid): 12–20% from average cost.
  - Mid/small caps: 10–15% from average cost (tighter discipline).
- Rebalance trigger: any position > +20% or <-15% relative change from target weight; quarterly mandatory review.
- Hedging: for portfolios >₹25L consider buying index PUTs (Nifty) or call spreads to cap tail risk during high volatility.

PART I — Scenario planning (numerical modeling: Bull / Base / Bear) Portfolio base-case calculation (using Tier weights + per-stock base returns)

- Base-case (central scenario): Weighted expected portfolio return ≈ 21.0% (12 months).
- Bull-case (favorable macro + re-rating): ~35%+ portfolio return — scenarios include multiple expansion and broad earnings beats (most holdings beat estimates; key catalysts realized).
- Bear-case (macro shock, commodity spike, rate shock): -10% to -25% portfolio drawdown (depending on exposure to financials and cyclicals).
- Tail-case (systemic credit shock or major geopolitical event): -40%+ potential drawdown — institutional funds should hedge or raise cash.

Numerical example (explicit)

- Using recommended allocation (8/6/3 scheme) the weighted base-case = 20.9% (rounded to 21%).
- Bull-case assumed 1.5× base upside on cyclical names + 1.2× on defensives → estimated ~35%.
- Bear-case assumed 50% or more haircut on satellite + 20–30% on core → -15% to -25%.

PART J — Entry, exit and profit-booking framework (actionable rules) Entry rules (execution)

- Use staggered buys (3–5 tranches) within entry band to average cost and reduce timing risk.
- Place limit orders within stated accumulation ranges (entry band).
- Avoid full position at a single price; use tranche sizes: 40% / 30% / 30% or 25% increments if using 4 tranches.

Profit-booking / exit rules

- Primary profit booking: Trim 20–40% of a position at target price or when stock reaches +25–35% above cost (depending on size/weight).
- Reallocation: rotate proceeds into underperformers that still meet fundamentals or keep cash.
- Stop-loss: Predefine stop-loss levels (12–20% for large caps; 10–15% for mid caps). Use mental or actual orders depending on liquidity.
- Trailing stop strategy: convert to trailing stop when position reaches +15–20% profits; e.g., 12% trailing stop from peak.

Event-driven exits

- Immediate exit (or heavy reduction) triggers:
  - Governance red flag (insider selling >2% or auditor resignation)
  - 3 consecutive quarter earnings misses or material order cancellations
  - Significant deterioration of asset quality (for financials)
  - Unexpected regulatory or legal events that materially impact business.

PART K — Monitoring framework & quarterly review checklist (operational) Quarterly checklist (for each stock)

- Revenue & EBITDA: growth vs consensus and prior quarter trend.
- Margins: gross, EBITDA, and net — watch 2-quarter directional changes.
- Cash flow: FCF and working capital swing (trend).
- Balance sheet: net debt movement, leverage ratios, interest coverage.
- Banks/NBFCs: GNPA, NNPA, PCR, stage-2 exposure, restructuring %.
- Orderbook / backlog (L&T, BEL): gross order inflow change.
- Deal pipeline (TCS/Infosys): large deal wins or cancellations.
- Product & capacity updates (Divi's, Ultratech): timelines and utilization.
- Promoter / institutional trades: >2% changes flagged.
- Governance alerts: auditor changes, management exits, related-party deals.
- Market signals: sector ETF flows, FII/DII flows, currency moves (INR).

Quarterly actions

- If a position >12% of portfolio, trim to target weight.
- If a stock drops 15–25% but fundamentals intact, consider topping up with max 25% of available cash.
- Rebalance to target weights quarterly; apply tax-aware harvesting annually (realize 10–15% gains in winners).

PART L — Rebalancing rules & execution notes

- Quarterly rebalancing is mandatory: trim winners and top-up losers within fundamental guardrails.
- Rebalance triggers:
  - If a holding exceeds target weight by >50% (e.g., target 6% becomes 9%), trim to target.
  - If a holding drops below 50% of target weight and fundamentals intact, top up to target in tranches.
- Tactical rebalancing:
  - Use cash buffer for opportunistic buys during market dips (>5–7% market correction).
  - Employ limit orders; avoid market orders in low-liquidity names.

PART M — Risk management & hedging (portfolio-level) Hedging considerations

- For portfolios >₹25L: buy Nifty put spreads (cost-efficient) to cap tail risk during uncertain macro.
- For targeted protection: use single-stock puts on large holdings if concentrated >10% weighting.
- Alternatives: use call overwrites on positions where you expect minor upside and want yield (income generation).

Concentration & liquidity rules

- No more than 12% in a single stock (unless one has highly risk-tolerant mandate).
- Ensure minimum 5% uninvested cash for quick entries on dips.
- For mid-cap holdings, maintain smaller position sizes and daily monitoring.

PART N — How to tilt the portfolio to achieve the "~25% target" (practical) Base-case portfolio with 8/6/3 weighting yields ~21% expected. To sensibly chase ~25% without excessive risk:

- Tactical tilt suggestions (choose one approach depending on risk appetite):

1. Moderate tilt (recommended for aggressive-but-controlled)
   - Increase weight in high-upside names: raise Infosys & Bajaj Finance from 8% → 10% each.
   - Increase ICICI from 6% → 8% and UltraTech / Eicher each from 3% → 5%.
   - Fund by reducing defensive staples (Nestle/HUL) by 1–2% each.

    - Expected incremental effect: portfolio expected return moves toward mid-23% to 25% depending on realized earnings.

2. High-conviction concentrated tilt (higher risk)

    - Move to a 12 stock concentrated portfolio: overweight high-upside cyclicals/ financials (Infosys, Bajaj Fin, ICICI, UltraTech, Eicher, BEL, Dr. Reddy's) at 8–12% each and reduce defensive staples weight.
    - This can lift expected outcome to ~25%+ BUT increases volatility, drawdown risk and idiosyncratic exposure — only for high risk-tolerance investors.

3. Leverage/Option overlay (institutional)

    - Keep base portfolio but purchase an out-of-the-money call spread or buy call options on 20–30% notional of portfolio concentrated in names where you expect large catalysts (Infosys, Bajaj Fin, UltraTech). Limited cost can generate outsized upside.
    - Or sell covered calls for income and buy put protection for downside.

Choose the tilt that best matches your risk tolerance and liquidity needs.

PART O — Performance projection table (numerical scenarios) Using recommended 8/6/3 weighting, per-stock base-upside assumptions:

- Weighted base-case expected return ≈ +21.0% (12 months)
- Bull-case (earnings beats + re-rating): +35% to +40% (plausible if multiple re-rating across IT, financials & cyclical recovery)
- Bear-case (macro shock / tightening): -10% to -25% (depending on credit & commodity shocks)
- Tail-case: -40%+ (systemic credit event or extreme geopolitical shock)

These are portfolio-level expectations and are scenario-based, not guarantees.

PART P — Final tactical & execution checklist (immediate next steps) If you are ready to implement:

1. Validate live market prices and closest quarter results for each stock.
2. Decide portfolio size and appetite for tilt (base / moderate-tilt / high-conviction).
3. Fund cash buffer 5–10% for tactical buys.
4. Deploy purchases in tranches (3–5) within entry bands with limit orders.
5. Tabulate actual purchased weights and enter tracker with stop-loss and review dates.
6. Setup alerts for key quarterly triggers listed above.

Appendix — Quick governance watchpoints (common across all picks)

- Promoter pledge >2% or increasing: FLAG.
- Auditor changes or regulator investigations: FLAG and reduce position until clarified.
- Insider selling >2%: investigate reason; consider trimming.
- Consecutive quarter misses: reevaluate; reduce to core conviction only after review.

Closing notes & offer

- This blueprint is a decision-ready, actionable 12-month investment plan built to be numerically grounded, risk-adjusted and sector-diversified. It ranks and explains the best 20 Indian stocks (conviction-ranked) along with entry zones, 12-month targets, allocation models for ₹10L/₹25L/₹50L, monitoring rules and scenario plans.
- Base-case blended expectation using conservative per-stock base upsides is ~21% over 12 months; with tasteful tactical tilts, the portfolio can be targeted to approach ~25% expected upside (see "How to tilt" above).
- I can now: A) Fetch live, per-stock up-to-the-minute P/E, EV/EBITDA, ROE, ROCE, Debt/Equity and latest quarterly revenue/EPS for each of the 20 names and update the tables; OR B) Prepare downloadable Excel sheets with scenario models (DCF & justified multiples) for the top 10 names first.

Which follow-up would you like me to perform now?
